

### Serial No.

## **Questions?**

As a manufacturer, we are committed to providing you complete customer satisfaction. If you have questions, or find there are missing or damaged parts, we will guarantee you complete satisfaction. To avoid unnecessary delays, contact your dealer immediately

Read all safety precautions and instructions in the manual carefully

# **OWNER'S MANUAL**

### WARRANTY

Voltair, Inc. warrants the Voltair against defective workmanship and parts in accordance with the warranty given to us by our suppliers for one full year. If during the warranty period it is thought that the unit becomes inoperative due to a defect, the Voltair needs to be returned to the dealer to determine the proper course of action. The dealer shall contact Voltair, Inc. regarding a warranty inspection or replacement. Voltair, Inc. reserves the right to void any warranty claim if the Voltair has been altered, shows bad maintenance, shows abuse, or has been dismantled without proper authorization. Voltair, Inc. can request that the unit be returned for inspection. Voltair will not warranty and is not liable for improper installation. Improper installation can be the result of poor judgment in running power to the compressor, not installing a circuit breaker or not using a DOT approved air storage tank.

VOLTAIR, INC. IS NOT RESPONSIBLE OR LIABLE FOR INDIRECT, SPECIAL OR CONSEQUENTIAL DAM-AGES ARISING OUT OF OR IN CONNECTION WITH THE USE OR PERFORMANCE OF THE PRODUCT OR OTHER DAMAGES WITH RESPECT TO ANY ECONOMIC LOSS, LOSS OF PROPERTY, LOSS OF REV-ENUES OR PROFITS, LOSS OF ENJOYMENT OR USE, COSTS OF REMOVAL, INSTALLATION OR OTHER CONSEQUENTIAL DAMAGES OF WHATSOEVER NATURE.

Voltair, Inc., Henderson, NE

Please read through these instructions before installing the 12-Voltair air compressor

### IMPORTANT SAFETY PRECAUTIONS

**WARNING:** To reduce the risk of burns, fire, electric shock, or injury to persons, read the following important safety precautions and information before operating this air compressor.

1.

### **BEFORE YOU BEGIN**

Thank you for selecting the 12-VOLTAIR air compressor. The 12-VOLTAIR is a heavy duty air compressor designed to let you accomplish most air related jobs away from the shop.

For safety and benefit, read this manual carefully before using the 12-VOLTAIR.

### ASSEMBLY

Be sure to check over the 12-Voltair and inspect for any damages.

### 1. Side Latches

Use the provided 1/4" x 1" bolt, lock washer and nut to secure the anchor bracket to the outside of the compressor. Once the anchor bracket has been secured use the 1/4" x 1 1/4" bolt and 1/4" lock nut to secure the rubber hold down in-between the ears of the anchor bracket.

Rubber Hold Down 1/4" x 1 1/4" Bolt 1/4" Lock Nut Anchor Bracket 1/4" x 1" Bolt Cabinet side 1/4" Nut

#### 2. Quick Coupler

Install the threaded nipple and quick coupler into the right side of the compressor through the two holes of the 12-Voltair cabinet.

**3. Remove Service Panel-** remove the 7 screws that hold the front service panel on the 12-Voltair. Once removed, there is no need to reattach until your installation is complete.

**4. Check Belt Tension**- Although the 12-Voltair has been shipped with the proper amount of belt tension, please check to make sure that it has not come loose during shipping.

**5.** Check Oil- The 12-Voltair is not shipped with any oil. It takes approximately 2 cups of oil to fill compressor to the full level on the dipstick. Do not overfill. See specs below on what oil should be used.

-20F - 70F (-7C - 21C)10W non detergent compressor oil50F - 110F (10C - 73C)30W non detergent compressor oil-20F - 110F (-7C - 73C)40W synthetic non detergent compressor oil

*Voltair recommends the use of synthetic non detergent compressor oil for year around use. Amsoil is just one manufacturer that can provide this oil (800) 956-5695 - part #PCKQT* 

### FINDING A LOCATION

In finding a location for your compressor...

- 1. Find a location in which the 12-Voltair can get adequate ventilation.
- 2. Find a location in which the 12-Voltair will not be overly exposed to dirt and dust.
- 3. Find a location in which the 12-Voltair can be properly fastened to ensure that it does not shift.
- 4. Check the underside to make sure that any drilling of holes will not interfere with existing lines or structure.

Once you have decided on a location for the 12-Voltair...

1) Set the unit into position

2) Mark the 3 holes on the right side of the compressor base onto the floor of your location.

3) Mark the 4 mounting holes of the base of the 12-Voltair on the floor of your location

4) Set the unit aside and get ready to drill some holes

### CAUTION:

Use good common sense when installing the 12-Voltair. When drilling holes for mounting, Electrical and plumbing, be sure to check the underside to make sure your drill will not interfere or damage existing lines, hoses or structure.

HOW BIG OF A HOLE SHOULD I DRILL? To eliminate any potential problems, Voltair recommends adding extra protection around the wires and hose (such as running the wires and hose through another hose, or use a rubber grommet). However you decide, drill a hole at least 1/8" bigger than the outside diameter of the hose/wires that will be run through the floor of your location.

8

Here is an example of protecting wires by either using 'another hose' or 'rubber grommet.'

Here is an example of securing the cabinet 'at a higher point' for a bed side mount

b) Bed Side Mount- use at least 2 of the for mounting holes on the base of the 12-Voltair as well as 2 H holes higher up on the back of cabinet as shown in the

a) Deck Mount- use all 4 mounting holes in base of the 12-

- 3/8" hole for 5/16" x 1 1/2" mounting bolts

- holes for electrical and plumbing

6) Once your holes are drilled, move the 12-Voltair back into position and use the provided 5/16" x 1 1/2" bolts, lock washer and nut to secure it to the floor. If possible also drill through the side of the

12-Voltair cabinet to secure it at a higher point.

Voltair frame.

above diagram.

Once the 12-Voltair is securely fastened to the vehicle go to next page.

5) Drill your holes

## ELECTRICAL

**What Size of Wire Should I Use?** A minimum of 4 gauge copper battery cable should be used for <u>both positive and ground</u> wire lengths up to 15 foot. For lengths of 15' - 30' use 2 gauge or 1 O copper wire

#### **GROUND WIRE**

IN most cases a short ground cable from the 12-Voltair to the frame of your vehicle is sufficient. When securing a ground to the frame of a vehicle be sure to sand/grind metal 'shinny' to ensure that the ground makes good contact. REMEMBER: When working with 12-Volt DC your positive connection is only as good as your ground. In other words, if you have a 'weak' ground connection you will not be able to get peak energy through the positive wire to the 12-Voltair.

**Step 1** Run the wire from the bottom of the vehicle up through the back hole of the 12-Voltair base.

**Step 2** Strip back about 3/4" of the outer covering of the battery cable and attach and secure to the 'loose' copper lug,

at the base of the motor, by either soldering or crimping.

Wrap the connection with electrical tape to complete the job, 'well done!'

Step 3 Secure to the bolt on the base of the motor

**Step 4** Run other end of the ground wire along frame of vehicle to ground location and secure. Be sure to use plastic tie straps to secure wire against frame.

#### **POSITIVE WIRE**

This wire should be run directly from the battery of the vehicle to the left side of the solenoid in the 12-Voltair. When running this wire be sure to keep it away from moving parts and exhaust. KEEP IN MIND that if the outer sheath of the battery cable wears through and makes contact with metal it will create a short and could cause major damage.

Step 1 Run wire from the bottom of the vehicle up through the front hole of the 12-Voltair base.

Step 2 Strip back about 3/4" of the outer covering of the battery cable and attach and secure to the copper lug by either soldering or crimping. Wrap the connection with electrical tape to complete the job, 'well done!'Step 3 Attach to the left side of the solenoid. Be sure that the copper eyelet is not making contact with any other metal objects.

**Step 4** Run other end of positive wire along frame of vehicle to the positive side of the battery. Be sure to use plastic tie straps to secure wire against frame. DO NOT USE WIRE.

#### **BATTERY FACTS**

1. The OEM (Original Equipment Battery) that came with the purchase of your vehicle is only designed to keep up with the demand of the vehicle. For optimum performance, Voltair recommends replacing your battery with a battery that is rated with 120 or more minutes of reserve.

2. The alternator that comes standard in most vehicles will charge between 40-50 amps at a vehicle idle. Since the Voltair draws 80 amps when in use, Voltair recommends a good battery and in some cases a second battery maybe necessary.

3. Voltair recommends a battery with 120 or more minutes of reserve. The 12-Voltair air compressor does not need cranking amps for optimum performance, but it does need battery reserve.

4. Over time a battery's ability to hold a full charge greatly diminishes. A lead battery may need to be replaced every 2 years and an optima battery may need to be replaced every 4 years.

5. If you are using or planning to use the 12-Voltair for more than 3-4 hours on a day-to-day basis adding a second battery will help in achieving optimum performance

### ELECTRICAL (OPTIONAL)

#### **TOGGLE SWITCH**

The Voltair is designed/manufactured with the solenoid activating the pressure switch. By default, when the pressure switch is in the on position, the Voltair will run whether the vehicle ignition is on or off. If your system would drop below 125 PSI, the compressor would kick on and run until the pressure reached 150- regardless of whether or not you are in the vehicle or not. To avoid this, Voltair, Inc. recommends installing a remote toggle switch and powering this switch with a keyed ignition power source. This way, the 12-Voltair will only run if <u>both</u> this switch and ignition are in the on position.

To turn the 12-Voltair on and off from a convenient location (i.e.- inside your vehicle) follow the steps below

**Step 1** Run an 18 gauge wire from the bottom of the vehicle up through one of the three holes of the 12-Voltair.

**Step 2** Remove the wire from the left side of the solenoid (the same terminal that the wire from the vehicle is hooked to) and connect to the wire you just pulled up.

**Step 3** Run the other end of the 18 gauge wire to the location (wherever you see fit to put the toggle switch) of the toggle switch and connect to one of the terminals.

**Step 4** Run a wire from the other terminal of the toggle switch to a 12-volt power source. Preferably a power source that only has power when the keyed ignition is in the on position. Consult your automobile manufacture to assist you in locating a 12 VDC power source, that only has power when the ignition is in the 'on' position.

#### YOUR SWITCH SHOULD BE READY TO GO

#### **CIRCUIT BREAKER**

One way to protect against the positive wire shorting is installing a circuit breaker. Voltair recommends a 150 amp circuit breaker. AW Direct is just one dealer who can be reached at (800) 243-3194 Part #SCB-150. This is a device that is mounted right next to your battery that will trip in the event that you have a wire that would short out.

![](_page_8_Picture_11.jpeg)

![](_page_8_Picture_12.jpeg)

### PLUMBING

**Choosing the right size** air storage tank. How much air storage you need can vary from task to task. In most cases a 10 gallon tank is adequate for filling/changing 1-2 tires at a time. Anything larger than 40 gallons is not recommended by Voltair. See chart below to help you determine how much air storage you need.

**Choosing a location for your air storage tank.** The great thing about air is that the inlet and outlet are one in the same. It is possible to plumb 2 or three tanks together with minimal fittings and confusion (see diagram 8.4) If you are mounting an air tank in an out of the way place then running your air hose from the compressor to your air storage through the floor is the best way to go. This hose will be run through the middle hole of the 12-Voltair base.

Step 1 Mount tank. See chart to determine how much air storage you need

Step 2 Anytime an air storage tank is to be mounted on a mobile vehicle, Voltair recommends using a D.O.T.

(Department of Transportation) approved air storage tank. (i.e.- brake tanks from semi trucks)

Step 3 Remove plug on bottom of manifold where the two quick couplers were screwed into

**Step 4** Run hose from the bottom of the vehicle up through the middle hole of the 12-Voltair base and attach to manifold where plug was removed.

Step 5 Connect the other end of the hose to the air storage tank.

### VOLTAIR, INC. RECOMMENDS USING A D.O.T APPROVED AIR STORAGE TANKS

![](_page_9_Figure_11.jpeg)

	Time It 1	Take To Fill Air Stora	age Tank	
	10 Gallon	20 Gallon	30 Gallon	40 Gallon
0-150 PSI	3 min	6 min	9 min	12 min
125-150 PSI	45 sec	90 sec	2 min 15 sec	3 min
Notes	Minimum Size			Maximum Size

![](_page_9_Picture_13.jpeg)

### MAINTENANCE

Under optimum conditions you can count on your 12-Voltair to provide "Air Where And When You Need It!" for a long, long time.

Check the items below atleast once a year or every 300 hours of use.

Check air filter and replace as needed Check oil level

Drain oil and replace if using a petroleum based non-detergent compressor oil

If you are using a synthetic based compressor oil drain oil every 3 years or 600 hours

Check Belt to make sure that it there is adequate belt tension

Check pump pulley to make sure that side flanges are securely fastened

Remove any debris that may have fallen inside the case of the 12-Voltair

Check positive (wire attached to left terminal of solenoid) to make sure that there is not any excessive wear and is still securely fastened.

Check plumbing to make sure that there are not any air leaks

To order parts consult your dealer or call (402) 723-4985

### WIRING

JVOLTAIR

![](_page_11_Picture_1.jpeg)

### TROUBLESHOOTING

### **MY 12-VOLTAIR NOT RUN**

1. Check if the switch on the pressure switch is in the auto (down) position

2. Check the air pressure. If you have more than 120 PSI in the compressor, the compressor will not kick in and run until the pressure has dropped below 120 PSI

# Before proceeding with this troubleshooting guide, be sure to disconnect the wire on the right side of the solenoid. This is the wire that goes to the inside of the motor.

- 3. Do you have a toggle switch? If not skip to 4.
  - Check if the toggle switch is in the on position
  - Check your wiring against the wire diagram on previous page
  - Check with a volt meter that you have voltage on at least one side of the switch (10-14 VDC) when the switch is in the off position
  - Check to see if you have voltage on both sides of the switch when the switch is in the on position
- 4. Do you have a circuit breaker? If not skip to 5.
  - Check to see if there is a reset on the circuit breaker
  - Check to see if you have voltage on both sides of the circuit breaker (10-14 VDC)
- 5. Check to see if the solenoid is working
  - Make sure the circuit breaker is engaged, the remote switch is on
  - Make sure the switch is in the off position

- Put you hand on the top side of the solenoid with one hand and turn the switch on the pressure switch on with the other hand. You should feel a click. If not you possibly have a bad solenoid. Double check with the next step (Be sure the wire on the right side of the solenoid is disconnected)

- With a volt meter check the solenoid using the two different sceneries

Scenario	Left Post	Top Post	Right Post
Circuit breaker on Remote Switch on Pressure switch off	10-14 VDC	0 VDC	0 VDC
Circuit breaker on Remote Switch on Pressure switch on	10-14 VDC	10-14 VDC	10-14 VDC

#### DIAGNOSIS

- If you don't get voltage on the top post in scenario #2 you have a bad pressure switch
- If you don't get voltage of the right post in scenario #2 you have a bad solenoid

#### 6. Was the compressor running and just quit?

- If the motor overheated (surface temp over 190F) than the thermal protector will have shut the system down until the temperature drops below 170F. This may take up to 30 minutes. **WARNING:** This is an automatic reset thermal protector- If all switches are on, and the thermal protector resets it will run without any warning. Never put hand in the box without <u>first disconnecting the power</u>.

![](_page_12_Picture_24.jpeg)

### TROUBLESHOOTING

### MY 12-VOLTAIR SHAKES A LOT.

1. Check to make sure there is adequate belt tension. You should have anywhere from 1/4" - 3/8" movement when applying 50% pressure to the belt directly between the motor and pump pulleys

2. Check to make sure that the motor and compressor are securely fastened to the frame. Make sure that bolts have not come loose.

#### MY 12-VOLTAIR RUNS BUT IS NOT ABLE TO PUMP UP ANY PRESSURE

1. Check to see if you have any external air leaks

- Disconnect any air storage tanks and plug tank supply line and run compressor to see if pressure builds up
- If this fixes the problem you have a leak that needs to be fixed

#### MY 12-VOLTAIR JUST STARTS - STOPS - STARTS - STOPS

You probably don't have an external air storage supply tank. The compressor is shutting down with 150
PSI in the air lines and a small leak is draining the pressure down to 125 PSI and the compressor is
kicking back on to build the pressure back up to 150 PSI.

# MY COMPRESSOR RUNS FAST AT BEGINNING BUT SOUNDS LIKE IT SLOWS DOWN AFTER IT HAS RUN FOR 5, 10, 15 MINUTES.

BATTERY

STEP 1 Recharge battery to make sure you have a good full charge if the problem still exists- STEP 2

STEP 2 Replace battery with a new battery. See battery facts on page 8 - if this does not

fix that problem- STEP 3

STEP 3 Check your alternator.

OPTION 1- Take it to a mechanic for him to check

OPTION 2- With an DC amp meter and the vehicle running, check the wire between the battery and the alternator to see if the alternator is charging

### WHEN RUNNING THE 12-VOLTAIR FOR EXTENDED PERIODS OF TIME, MY VEHICLE JUST SHUTS OFF

BATTERY- check the steps above to diagnose a problem

### HOW DO I ADJUST MY PRESSURE SWITCH

![](_page_13_Picture_21.jpeg)

![](_page_13_Picture_22.jpeg)

### WARRANTY

#### 12-Voltair Warranty Card
